### RESULT 1 ADR10602 Antiasthmatic; Antiallergic; Immunosuppressive; IgE; dog; asthma; anaphylactic shock; 5.91 monoclonal antibody; 3.76 monoclonal antibody; Felis catus. Cat IgE epitope recognised 21-OCT-2004 ADR10602; ADR10602 standard; peptide; 15 15-JAN-2004; 2004WO-US003566 05-AUG-2004 WO2004065936-A2 (first entry) by monoclonal antibody 5.91, SEQ ID ₽

ALIGNMENTS

The present invention relates to a novel monoclonal antibody (I) that specifically binds to a mammalian IgE epitope, where the epitope is between amino acids 145-166 or 356-374 of mammalian IgE, e.g. dog IgE. (I) is useful for testing an allergen reactivity of an IgE sample. The allergen is chosen from mold, pollen, dust mite, milk, egg, soy, peanut and corn allergens. The sample is a biological sample collected from a dog, cat or horse. (I) is also useful for detecting mammalian IgE and for treating asthma or anaphylactic shock. The 5.91 and 3.76 monoclonal antibodies recognise epitopes on canine IgE corresponding to amino acid residues 357-371 (ADR10601) and 146-162 (ADR10609) respectively of the

Novel antibody that specifically binds to mammalian IgE epitope, useful for testing an allergen reactivity of IgE sample, detecting mammalian Igor treating asthma or anaphylactic shock.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ននិនិនិនិនិង
                                                                                                                                                                The present invention relates to a novel monoclonal antibody (I) that CC specifically binds to a mammalian IgE epitope, where the epitope is between amino acids 145-166 or 356-374 of mammalian IgE, eg. dog IgE. (I) is useful for testing an allergen reactivity of an IgE sample. The allergen is chosen from mold, pollen, dust mite, milk, egg, soy, peanut and corn allergens. The sample is a biological sample collected from a collec

Recognition of epsilon-chains from IgE from cat, horse, pig and human by 5.91 and 3.76 were observed to have good cross-reactivity with the epsilon-chain of IgE from cat and horse, but did not exhibit cross-reactivity with either pig or human epsilon-chains of IgE. The present sequence is the cat IgE 5.91 recognition site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel antibody that specifically binds to mammalian IgE epitope, useful for testing an allergen reactivity of IgE sample, detecting mammalian I or treating asthma or anaphylactic shock.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                닭
                                                                                                                                                                                                               The present invention relates to a novel monoclonal antibody (I) that CC specifically binds to a mammalian IgE epitope, where the epitope is compectation acids 145-166 or 356-374 of mammalian IgE, e.g. dog IgE. CC between amino acids 145-166 or 356-374 of mammalian IgE, e.g. dog IgE. CC (I) is useful for testing an allergen reactivity of an IgE sample. The candidate corn allergens. The sample is a biological sample collected from a cc dog, cat or horse. (I) is also useful for detecting mammalian IgE and for treating asthma or anaphylactic shock. The 5.91 and 3.76 monoclonal cantibodies recognise epitopes on canine IgE corresponding to amino acid cresidues 357-371 (ADR10601) and 146-162 (ADR10609) respectively of the CC canine IgE epsilon-chain. Recognition of epsilon-chains from IgE from CC cat, horse, pig and human by 5.91 and 3.76 was examined. Both 5.91 and CC 3.76 were observed to have good cross-reactivity with the epsilon-chain cc of IgE from cat and horse, but did not exhibit cross-reactivity with ceither pig or human epsilon-chains of IgE. The present sequence is the corresponding or proposition of the construction of the corresponding to the corresponding to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     S

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CC specifically binds to a mammalian IgE epitope, where the epitope is CC between amino acids 145-166 or 356-374 of mammalian IgE, e.g. dog IgE. CC (I) is useful for testing an allergen reactivity of an IgE sample. The CC allergen is chosen from mold, pollen, dust mite, milk, egg, soy, peanut CC and corn allergens. The sample is a biological sample collected from a CC dog, cat or horse. (I) is also useful for detecting mammalian IgE and for CC treating asthma or anaphylactic shock. The 5.91 and 3.76 monoclonal CC residues recognise epitopes on canine IgE corresponding to amino acid CC residues 357-371 (ADR10601) and 146-162 (ADR10609) respectively of the CC canine IgE spsilon-chain. Recognition of epsilon-chains from IgE from CC cat, horse, pig and human by 5.91 and 3.76 was examined. Both 5.91 and CC of IgE from cat and horse, but did not exhibit cross-reactivity with CC either pig or human epsilon-chains of IgE. The present sequence is the CC horse IgE 5.91 recognition site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches

                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an immunogenic composition comprising an CC isolated polypeptide having an amino acid sequence that is at least 80% cidentical to 6 (S1-S6), 15 amino acid sequences derived from CC equine immunoglobulin E (the composition induces production of an CC antibody that specifically binds to equine immunoglobulin (Ig)E), the six CC polypeptides are not explicitly identified in the specification. Also CC included are a composition comprising an antibody that specifically binds to equine IgE made by the process of immunising an CC antibody that specifically binds to equine IgE made by the process of immunising an CC antibody that specifically binds to equine IgE made by the process of immunising an CC animal with a polypeptide at least 80% identical to (S1)-(S6), making an CC animal with a composition further comprising an isolated polypeptide (the CC amino acid sequence of the polypeptide is at least 80% identical to (S1)-CC (S6)), and collecting antiscrum from the animal) and a kit for detection of equine IgE in a biological sample comprising the antibody and means CC for detecting specific binding of the antibody to equine IgE. The CC antibody is useful for detecting equine IgE protein in a biological sample (serum) which involves contacting the sample with the antibody. The complex of the antibody and antigen are complex (secundary) and antigen are antibody is labelled such that the complex of the antibody and antigen are useful for detected using a second labelled complex as a diagnostic test for allergy. The present CC applied from the early portion of the C4 region.
                                                                                                                                                                                                                                                                                                                     Matches

CC a member of the ATP-binding cassette (ABC transporter) superfamily of intracellular cholesterol trafficking in monocytes and fibroblasts, being convolved in cholesterol efflux from the cell. The gene encoding ABC1 is clocated on chromosome 9g1, and mutations in this gene are associated with two genetic HBL (high density lipoprotein) deficiency disorders, compared disease (TD) and familial HBL deficiency (FHA). These diseases for an autosomal dominant trait. Low levels of HBL ("good colesterol") in the blood correlate with a high risk of cardiovascular codisease, coronary restenosis, and peripheral vascular disease. Conversely, a high level of HBL has protective effects against cardiovascular disease comprising the similate ABC1 actids, and methods of gene therapy for the treatment or prevention of corresponder encompasses compounds which mimic ABC1 activity, compounds which mimic abcoment of prevent cardiovascular disease, especially disease, coronary restenosis of gene therapy for the treatment or prevention also coresponds which mimic ABC1 activity, compounds which mimic abc1 disease due to polymorphisms in the CC further relates to methods for determining whether a patient has an correspond to the protess and nucleotides can be used to treat or corresponds. It for a standard disease, especially coronary artery disease, coronary restenosis or peripheral vascular disease, with the exact amino acid cardiovascular disease, especially coronary artery disease, especially excludes proteins with the exact amino acid cardio with the exact sequence as GenBank Accession No: AD12376. 1 The creator transporter peptide fragment used in the exemplifications of the invention

(I) has cytostatic activity, and can be used in antibody-directed enzyme activated prodrug therapy. The elastase variant can be used to cleave a particular substrate, especially those containing histidine residues at the substrate site. Site-specific proteolysis is useful in therapeutic at the substrate site. Site-specific proteolysis is useful in therapeutic at phications, e.g. for antibody-directed enzyme activated prodrug therapy (ADEPT). AAC88022, AAC88023 and AAB55532 to AAB55526 represent sequences used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; elastase; human neutrophil

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The peptides given in AAR55718-48 can each be conjugated through an amide linkage with a polyunsaturated fatty acid moinery, such as docosahexaenoic acid or eicosapentanoic acid, to improve antiproliferative activity. The dsDNA-dependent kinase inhibitor given in AAR55733 competes with native kinases associated with meoplastic cell proliferation or transformation, psoriasis, etc. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New fatty acyl-peptide conjugates for inhibiting cell proliferation more active than free peptide, partic. for treating tumours, virus-

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               0
```

A cysteine protease inhibitory ADR97086 at its N-terminal and

protein (I) having the amino acid sequence exhibiting the molecular weight of 31 kDa,

```

                      They can be used to control insects pests from the Lepidoptera, Coleoptera, Hymenoptera, Diptera, Dictyoptera, Acarina or Homoptera orders, especially the Southern or Western corn rootworm, Colorado porders, especially the Southern or Western corn rootworm,
                                                                                                   This is a symbiotic bacterium of the nematodes of the Heterorhabditis genus. The bacterium has at least 4 distinct genomic regions, tca, tcb, tcc, and tcd. Peptide products are produced from these regions that are associated with insecticidal activity. The native toxins are secreted proteins. The proteins are toxic to insects upon exposure and especially when ingested. The nucleic acid sequence can be used to produce transgenic plants, baculoviruses or microbial hosts for toxin production.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               is new. (I) is useful for screening a compound or its salt having activity of promoting or inhibiting the function of (I). (I) enables diagnosis, prevention or treatment of Behcet's disease or Harada's disease. This sequence is a fragment of the cysteine protease inhibitory
                                                                                                                                                                                                                                                                                            The present sequence represents a fragment of the toxic protein TcaC (encoded by gene tcaC) of the bacterium Photorhabdus luminescens (W-14).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (DOWC )
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      tcb; tcc; tcd; insecticidal activity; toxin; Lepidoptera; Coleoptera; Hymenoptera; Diptera; Dictyoptera; Acarina; Homoptera; Southern; Western corn rootworm; Colorado potato beetle; mealworm; boll weevil;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match
                                                                            AAW76007-W76040 are protein fragments of the grafted monoclonal antibody LM609 heavy and light chain variable region. LM609 and the antibody vitaxin bind selectively to integrin alphavbeta3 and can be used to inhibit binding of alphavbeta3 to a ligand and thus block integrin-mediated signal transduction. This is useful in the treatment, prevention and diagnosis of alphavbeta3-mediated disease, specifically angiogenesis and restenosis (but also e.g. (non-)lmmune inflammation, diabetic retinopathy, neovascular glaucoma, cancer, psociasis, rheumatoid arthritis, macular degeneration, osteoporosis etc.). The antibodies contain non-murine framework regions so are suitable for use in humans. Enhanced types of LM609 have affinity more than 90 times greater than
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             cabbage

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       LM609; antibody; grafted antibody; alpha_vbeta_3; angiogenesis; CDR;
alpha_vbeta_3-mediated disease; complementarity determining region;
restenosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a Vitaxin or LM609 grafted antibody, exhibiting selective binding affinity to alpha vbeta 3. The Vitaxin or LM609 grafted antibody is useful for treating an alpha-vbeta_3-mediated disease e.g. angiogenesis or restenosis. The present sequence represents the amino acid sequence of a LM609 complementarity determining region
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New Vitaxin or LM609 grafted antibody exhibiting selective binding affinity to alphavbeta3, useful for treating an alphavbeta3-mediated disease e.g., angiogenesis or restenosis.
                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 9 AA;

                                                                                                                                                                                                                                                                                          The present sequence is that of a surface simulation synthetic peptide (SSSP) corresponding to a non-sequential conserved residue epitope of HIV -1 glycoprotein gp120 required for viral pathogenicity. It is an example of SSSPs of the invention, which incorporate amino acid sequences that simulate the 3-dimensional spatial positions of non-sequential conserved residues necessary for viral pathogenicity. The SSSPs are useful for incorporation into vaccines effective in eliciting an effective broad spectrum immune response against hyper-variable viral pathogens such as HIV-1, and in diagnostic kits. SSSPs provide a reliable strategy for allowing the immune system to process and recognise discontinuous epitopes and to mount immune responses to the 3-dimensional configurations of targeted proteins
                                                                                                                                                                                                                                                        Sequence 9 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Configuration of synthetic peptides useful for treating hyper-variable viral pathogen e.g. HIV, involves identifying non-sequential conserved residues in selected viral proteins and designing a sequence from image scan of the residues.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         DB seq

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Total number of hits satisfying chosen parameters:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Scoring table:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              88

Sequence 429, Application US/10538066

Publication No. US20060094649A1

GENERAL INFORMATION:
APPLICANT: Epimmune Inc.
TITLE OF INVENTION: HLA-A1, -A2, -A3, -A24, -B7, and -B44 Tumor Associated Antigen
TITLE OF INVENTION: Deptides and Compositions
FILE REFERENCE: 2060.015PC06

CURRENT APPLICATION NUMBER: US/10/538,066
CURRENT FILING DATE: 2005-06-09
PRIOR APPLICATION NUMBER: US 60/432,017

Hammerberg B;

Novel antibody that specifically binds to mammalian IgE epitope, useful for testing an allergen reactivity of IgE sample, detecting mammalian I or treating asthma or anaphylactic shock. IgE

WPI; 2004-593545/57.

Example 6; Page 9; 14pp; English.

The present invention relates to a novel monoclonal antibody (I) that specifically binds to a mammalian IgE epitope, where the epitope is between amino acids 145-166 or 356-374 of mammalian IgE, e.g. dog IgE. (I) is useful for testing an allergen reactivity of an IgE sample. The allergen is chosen from mold, pollen, dust mite, milk, egg, soy, peanut and corn allergens. The sample is a biological sample collected from a dog, cat or horse. (I) is also useful for detecting mammalian IgE and for treating sathma or anaphylactic shock. The 5-91 and 3.76 monoclonal antibodies recognise epitopes on canine IgE corresponding to amino acid residues 357-371 (ADR10601) and 146-162 (ADR10603) respectively of the IgE epsilon-chain. Recognition of epsilon-chains for

                                                                                                                                          CC The present invention relates to a novel monoclonal antibody (I) that CC specifically binds to a mammalian IgE epitope, where the epitope is CC between amino acids 145-166 or 356-374 of mammalian IgE, e.g. dog IgE. CC (I) is useful for testing an allergen reactivity of an IgE sample. The CC allergen is chosen from mold, pollen, dust mite, milk, egg, soy, peanut CC and corn allergens. The sample is a biological sample collected from a CC dog, cat or horse. (I) is also useful for detecting mammalian IgE and for CC treating asthma or anaphylactic shock. The 5.91 and 3.76 monoclonal CC antibodies recognise epitopes on canine IgE corresponding to amino acid CC residues 357-371 (ADR10601) and 146-162 (ADR10609) respectively of the CC canine IgE epsilon-chain. Recognition of epsilon-chains from IgE from CC at, horse, pig and human by 5.91 and 3.76 was examined. Both 5.91 and CC 3.76 were observed to have good cross-reactivity with the epsilon-chain CC of IgE from cat and horse, but did not exhibit cross-reactivity with CC either pig or human epsilon-chains of IgE. The present sequence is the CC pig IgE 5.91 recognition site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       밁

Both 5.91 and 3.76 were observed to have good cross-reactivity with the epsilon-chain of IgE from cat and horse, but did not exhibit cross-reactivity with either pig or human epsilon-chains of IgE.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel antibody that specifically binds to mammalian IgE epitope, useful for testing an allergen reactivity of IgE sample, detecting mammalian I or treating asthma or anaphylactic shock.
                                                                                            Sequence 15
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Antiasthmatic; Antiallergic; Immunosuppressive; IgE; dog; asthma; anaphylactic shock; 5.91 monoclonal antibody;

CC (I) is useful for testing an allergen reactivity of an IgE sample. The callergen is chosen from mold, pollen, dust mite, milk, egg, soy, peanut CC allergen is chosen from mold, pollen, dust mite, milk, egg, soy, peanut CC and corn allergens. The sample is a biological sample collected from a CC dog, cat or horse. (I) is also useful for detecting mammalian IgE and for treating asthma or anaphylactic shock. The 5.91 and 3.76 monoclonal CC treating asthma or anaphylactic shock. The 5.91 and 3.76 monoclonal CC catious seepilon-chain. Recognition of Egg corresponding to amino acid CC catious 357-371 (ApR10601) and 146-162 (ApR10609) respectively of the CC canine IgE epsilon-chain. Recognition of epsilon-chains from IgE from CC cat, horse, pig and human by 5.91 and 3.76 was examined. Both 5.91 and CC cat, horse, pig and horse, but did not exhibit cross-reactivity with the epsilon-chain epsilon-chains of IgE from cat and horse, but did not exhibit cross-reactivity with the epsilon or human epsilon-chains of IgE. The present sequence is the

                                                                                                                                                                                                                                                                                                                                                                                 밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     specifically binds to a mammalian IgE epitope, where the epitope is between amino acids 145-166 or 356-374 of mammalian IgE, e.g. dog IgE. (I) is useful for testing an allergen reactivity of an IgE sample. The allergen is chosen from mold, pollen, dust mite, milk, egg, soy, peanut and corn allergens. The sample is a biological sample collected from a dog, cat or horse. (I) is also useful for detecting mammalian IgE and for treating asthma or anaphylactic shock. The 5.91 and 3.76 monoclonal antibodies recognise epitopes on canine IgE corresponding to amino acid residues 357-371 (ADR10601) and 146-162 (ADR10609) respectively of the canine IgE epsilon-chain. Recognition of epsilon-chains from IgE from cat, horse, pig and human by 5.91 and 3.76 was examined. Both 5.91 and and in the case of the canine IgE and human by 5.91 and 3.76 was examined.
                                                                                                                                                                                                                                                                                                                                                                                                                 3.76 were observed to have good cross-reactivity with the epsilon-chain of IgE from cat and horse, but did not exhibit cross-reactivity with either pig or human epsilon-chains of IgE. The present sequence is the horse IgE 5.91 recognition site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel antibody that specifically binds to mammalian IgE epitope, useful for testing an allergen reactivity of IgE sample, detecting mammalian IgE or treating asthma or anaphylactic shock.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Antiasthmatic; Antiallergic; Immunosuppressive; IgE; dog; asthma; anaphylactic shock; 5.91 monoclonal antibody; 3.76 monoclonal antibody;

CC isolated polypoptide having an amino acid sequence that is at least 80% cc identical to 6 (S1-S6), 15 amino acid sequence that is at least 80% cc identical to 6 (S1-S6), 15 amino acid sequences derived from cc quine immunoglobulin [G]E), the six composition induces production of an expectation of the six cc polypoptides are not explicitly identified in the specification. Also cc included are a composition comprising an antibody that specifically binds to equine immunoglobulin (Ig)E), the six composition are polypoptide at least 80% identical to (S1)-(S6), an antibody that specifically binds to equine IgE made by the process of immunising an animal with a composition further comprising an isolated polypoptide (the amino acid sequence of the polypoptide is at least 80% identical to (S1)-(S6), making an cc amino acid sequence of the polypoptide is at least 80% identical to (S1)-(S6), and collecting antiserum from the animal) and a kit for detection cof equine IgE in a biological sample comprising the antibody and means cf of detecting specific binding of the antibody to equine IgE. The cample (serum) which involves contacting the sample with the antibody, the sample with the antibody. Camplex can be detected. The complex. The antibody and antigen are complex can be detected. The complex is detected using a second labelled cantibody. The poptides are useful for generating antibodies specific for IgE which can serve as a diagnostic test for allergy. The present cc poptide from the early portion of the C4 region.

The protein, especially F protein, is useful for CC expression, designing and/or modifying an agent capable of interacting CC with a viral F protein or its derivative and modulating a functional CC activity associated with the protein, by contacting the protein with a CC putative agent and assessing the degree of interactive complementarity of CC the agent with the protein. An optimised nucleic acid or its derivative, CC equivalent, analogue or mimetic is useful for interacting with a viral F CC protein and modulating a functional activity associated with the viral CC protein, for use in the manufacture of a medicament utilised in the CC therapeutic and/or prophylactic treatment of conditions characterised by infection with a negative sense single stranded RNA virus, and for CC modulating a functional activity associated with a viral F protein in a CC subject, preferably a mammal, especially a human, where the functional CC subject, preferably a mammal, especially virion fusion and/or virion budding and the modulating is down regulation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a method for facilitating production of a CC protein or its derivative from a negative sense single stranded RNA CC virus, by expressing a nucleic acid molecule encoding the protein in a CC host cell, where the nucleic acid is optimised for expression by a CC eukaryotic cell. The protein, especially F protein, is useful for CC analysing, designing and/or modifying an agent capable of interacting CC with a viral F protein or its derivative and modulating a functional CC extivity associated with the protein, by contacting the protein with a CC putative agent and assessing the degree of interactive complementarity of the agent with the protein. An optimised nucleic acid or its derivative, CC equivalent, analogue or minetic is useful for interacting with a viral F CC protein and modulating a functional activity associated with the viral CC protein, for use in the manufacture of a medicament utilised in the CC therapeutic and/or prophylactic treatment of conditions characterised by infection with a negative sense single stranded RNA virus, and for CC modulating a functional activity associated with a viral F protein in a CC subject, preferably a mammal, especialty a human, where the functional CC activity is F protein mediated host cell virion fusion and/or virion CC budding and the modulating is down regulation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     antibodies against these fragments could be used to confer short-term protection against the RS virus. The vaccine can then be used to protect humans and animals (for animals, the RS sequence used is from the RS virus of that species). The dose of the vaccine is 0.1-100 micro grammes per kg body weight. The vaccine can also be used in diagnosis, such as immunoassays. The DNA encoding this sequence can be used in hybridisation tests to detect RS virus in blood. The antibodies can be used to identify viral epitopes. The advancage with using this methodology is that there is no enhancement/potentiation of the disease seen with current treatments. (Updated on 25-MAR-2003 to correct PF field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Paradiso

This sequence corresponds to residues 261-273. These fragments were used to create antibodies. The DNA encoding these fragments is inserted into expression vectors and used to transform cell cultures, the expressed protein is then isolated and purified. These peptide fragments are then used in a vaccine. Alternatively, the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sub-unit vaccine against respiratory syncytial polypeptide related to neutralising epitope on

pharmaceutical formulations. Receptor expressing cells, preferably transfected ex vivo, can be used similarly by implantation, and the use of the receptor cDNA in gene therapy is also contemplated. Probes based on the cDNA can be used to identify GDNF responsive cells and tissues, e.g. to identify patients who would benefit from GDNF therapy, and abnormalities in receptor expression, and to isolate molecules that form a complex with the cDNA or are homologous/cross-reactive with the cDNA. Anti-receptor antibodies, oligonucleotides derived from the cDNA and animal models that overexpress the receptor can be used to study the biological function of GDNF, knockout transgenic animals can be used to detect GDNF dependent neurons or processes and the antibody can be used in immunoassays for the receptor. The receptor binds GDNF specifically and with high affinity, acting as part of a complex that mediates/enhances signal transduction by GDNF, i.e. increasing dopamine
                                                                                                                                                                                                                                                                                                                                                                                                                                     Huntington's disease and (optionally in combination with GDNF) glaucoma, retinal degeneration and hearing loss caused by injury to inner ear sensory neurons. The receptor can also be used to block unwanted GDNF activity, analyse GDNF related molecules and stabilise GDNF in pharmaceutical formulations. Receptor expressing cells, preferably transfected ex vivo, can be used similarly by implantation, and the use
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present peptide is derived from rat glial cell line-derived neurotrophic factor (GDNF) receptor, which can be used to treat dopaminergic nerve cell disorders, e.g. Parkinson's and Alzheimer's disease or amyotrophic lateral sclerosis, complications of diabetes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Glial cell line derived dopaminergic nerve cell

It consists an activity of GDNPR-alpha. The peptide may also CC possess an activity of GDNPR-alpha. The GDNPR-alpha protein is capable of CC complexing with glial cell line-derived neurotrophic factor (GDNP) and CC mediating cell response to GDNP. GDNPR-alpha proteins are functionally CC characterised by the ability to bind GDNP and/or neurturin specifically. CC and to act as part of a molecular complex which mediates or enhances the CC signal transduction affects of GDNP and/or neurturin. The proteins can be used for treating improperly functioning dopaminergic nerve cells, CC parkinson's disease, Alzheimer's disease or amyotrophic lateral CC sclerosis. They can also be used for treating neurological disorders associated with diabetes, glaucoma or other diseases and conditions CC involving retinal ganglion cell degeneration, sensory neuropathy caused by injury to, insults to, or degeneration, sensory neurons, CC pathological conditions, or disease or injury-related retinopathies. The products can also be used for detection, diagnosis, drug screening and

The invention relates to a new polynucleotide comprising a multi-epitope construct comprising nucleic acids encoding the human papillomavirus (HPV) cytotoxic T lymphocyte (CTL) epitopes e.g., HPV16.El. 214, and that care directly or indirectly joined to one another in the same reading cframe, a vaccine minigene. Also included are a vector comprising the multi-epitope construct, a polypeptide comprising a maino acid sequence encoded by the polynucleotide, a composition (comprising the polynucleotide, vector and/or polypeptide and a carrier), a cell comprising the polynucleotide, vector or polypeptide, inducing an immune response against human papillomavirus virus (HPV) and making the colynucleotide, vector or polypeptide. The epitopes are derived from the Ell E2, E6 and E7 proteins. The epitopes may be linked via a GP-anchor/spacer peptide. The order of the epitopes may be linked via a GP-anchor/spacer peptide. The order of the epitopes in the vaccine protein are disposed in the tables referred to in the claims of the specification. The polynucleotide, vector or polypeptide is useful in preparing a composition for inducing an immune cresponse against human papillomavirus virus (HPV) and thus providing a defense against human papillomavirus virus (HPV) and thus providing a captore is an HPV-derived peptide epitope that binds to a subclass of human leukocyte antigen (HLA) peptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Chesnut Chen Y,

CC The present sequence is a peptide encoded by one such oligonucleotide. CC The oligonucleotides and the peptides encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with CC inappropriate expression of the proteins listed above. Disorders that may be prevented, diagnosed and/or treated include multifactorial diseases (c) arthritis, multiple sclerosis, diabetes, systemic lupus erythromatosus and Grave's disease), inflammation, cancer (e.g. cancers of the bladder, branch, breast, colon and kidney, leukaemia), diseases of the nervous
                                                                                                                                                                                                                                                                                                                                                                                                                                Query Match

The antibody comprises a Variable Heavy Complementarity Determining Region (VHCDR). VHCDR2 or VHCDR3 and a Variable Light Complementarity Determining Region (VLCDR). VLCDR2 or VLCDR3. The antibody prevents binding or inhibits interaction of NogoR with: p75(NTR) (AED12288); INGO-1 (AED12289); Nogo (AED12285); OMGP (AED12286); or MAG (AED12287), and promotes neurite outgrowth or axonal regeneration. The antibody is useful in preparing a composition for treating or ameliorating spinal cord injury, brain trauma, paralysis, neurodegenerative disorders or stroke. The present sequence is a CDR peptide sequence for one such scFv that binds to NogoR.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New antibody or its fragment that specifically binds Nogo receptor (NogoR), useful in preparing a composition for treating or ameliorating spinal cord injury, brain trauma, paralysis, neurodegenerative disorders or stroke.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 14 AA;

CC This invention describes a novel structural protein (I) of adeno-
CC associated virus (AAV) which has at least one mutation that alters the
CC chromatographic properties of the virus. The invention also describes (1)
CC anucleic acid (II) that encodes (I); (2) a cell (III) containing (II);
CC and (3) producing (I) comprising culturing (III). (II) and (III) are
CC used to purify AAV and its particles, to alter the tropism or
CC antigenicity of AAV, to transform cells, for genomic targeting, for
CC diagnosis, for examination of activity and/or gene therapy. Altering the
CC concentration of virus and produces viral particles to a higher titre or
higher purity and/or provides more efficient purification, especially
CC and a quicker and less expensive process). Particularly, mutated (I)
CC concentration than the wild type, which tends to co-elute with other
CC viruses, serum proteins and cellular debris, or that include a specific
CC affinity tag. Mutation may also allow targeting of cells, e.g.
CC hematopoietic cells, that are not normally targets for AAV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

The structural proteins are used to alter the tropism of AAV, to transform cells, for diagnosis and for effectivity studies for gene therapy and/or for genomic targeting. AAY51446-Y51467 represent AAV derived peptides used to illustrate the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  VP3 protein; structural protein; chromatography; tropism; antigenicity;
